New polynucleotides encoding human secreted proteins - derived from
PT e.g. human blood, kidney, foetal lung, placente, testes, brain,
PT e.g. human blood, kidney, foetal lung, placente, testes, brain,
PT e.g. human blood, kidney, foetal lung, placente, testes, brain,
PT ovary, pituitary, retina and colon CDNA libraries
Claim 1: Page 119; 633pp; English
CC claim 1: Page 119; 633pp; English
CC claim 2: Sequence represents an expressed sequence tag (EST), and is a
polynucleotide of the invention. The polynucleotides of the invention are
call secreted EST sequences insolated from a variety of human tissue
cources: The EST sequences and proteins encoded by them are predicted to
have useful biological activitities which would make them suitable for
treating, preventing or ameliorating medical conditions in humans and
animals, although no supporting data is given. Suggested activities
conditional activity, immune stimulating or suppressing activity,
hammatopolesis regulating activity, tissue growth activity,
activity, nactivity, receptor/ligand activity, and ti-inflammatory
cativity, cabherin/tumour invasion suppressor activity, tumour inhibition
controlly the EST sequences are also stated to be useful for gene
                                                                                                                                                                                                                                                  EST clone D310.

EST clone D310.

                                                                                                                                                                                                            This sequence represents a E. coli nucleotide sequences - used to develop products for the detection of pathogenic E. coli and to develop products for the detection of pathogenic E. coli and to alicit an immune response to pathogenic E. coli and 21; Page 84-88; 250pp; English.

This sequence represents a E. coli strain J96 contig containing pathogenicity island (PAI) sequences, and represents a nucleic acid molecule of the invention. PAIs are large fragments of DNA which comprise pathogenicity determinants. The sequences of the invention are taken from PAII V and PAII V. PAII IV is located at approximately 64 min (near pheV) con the E. coli chromosome and is greater than 170 kb. PAI V is located at approximately 94 min (at pheR) on the E. coli chromosome and is specific to the proteins encoded approximately 160 kb in size. Antibodies specific to the proteins encoded detect uropathogenic E. coli. The proteins are used in vaccines to elicit approach immune response in an animal to the uropathogenic E. coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              01-0cT-1998 (first entry)
E. coli J96 pathogenicity island contig #3.

                                                        New isolated Treponema pallidum nucleic acids - used to develop products for the detection, diagnosis, characterisation, prevention and therapy of T. pallidum infections, particularly syphilis claim 1, Page 523-527; 1150pp; English.

X20500-21243 represent polynucleotide sequences from the genome of Treponema pallidum. The sequences can be used for detection, diagnosis, characterisation, prevention and therapy for T. pallidum infections, particularly syphilis. They can also be used for detecting diseases related to Borrella infections in animals, and for the production of blosynthetic products such as enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ë
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     2071 G;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps: 6 Gaps: 0 Percent Identity: 100.000

synthetase like activity
Claim 6; Page 17-41; 93pp; English.
This sequence encodes an enzyme which has cyclosporin synthetase-
like activity. This sequence was isolated from Tolypocladium niveum
like activity. This sequence was isolated from Tolypocladium niveum
(formerly known as T. inflatum GAMS). The enzyme encoded by this
sequence catalyses the peptide blosynthesis of cyclosporins and
structurally related molecules. This sequence may be used for the
production of cyclosporin by transforming a vector containing this
sequence in to a recombinant host. This allows effective production
of antibiotic cyclosporin or its derivatives.

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (RAM), read-only memory (RAM) or CD-RAM. Homology searches using the S. aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be obtained. Secureus infection. The be used in a vaccine composition against S.aureus infection. The polypeptides can also be used in a kit for the immunodetection of Saureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food polsoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 iocation/Qualifiers

                                                                        Example 5: Page 63; 79pp; English.
A DNA clone (T43366) was generated by 5'RACE using primers (see also T43364-56) based on FbLate2 clone All (T43362), a partial CDNA clone corresponding to mRNA prevalent in the late development of cotton fibre. The RACE product showed 91.6% similarity at the nucleotide level to the genomic clone, FbLate2-82A (see also T43360). The homology of the RACE product started from nucleotide position 2269 of the FbLate2-28A gene. The ATG initiation codon was identified at position 2315 of the gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Rosen CA;
     A single-stranded DNA (or its complementary strand or the corresp. A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences of given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed CDNA libraries prepared from various human tissues; synthesis of CDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-ent of mRNA by using poly(T) as the sole primer. Since the 3'-ent of mRNA by using poly(T) as the sole primer since the 3'-ent of mRNA by using poly(T) as the sole primer. Since the 3'-ent of mRNA by using poly(T) as the sole primer of the section of all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different from the GS sequences) as a means of diagnosing abnormal cell function or for sequence 15 BP; 80 A; 23 C; 43 G; 67 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matsubara K, Okubo K;
WPI: 95-206931/27.
Identifylng gene signatures in 3'-directed human cDNA library - e.g.,
for diagnosis of abnormal cell function, by preparing cDNA that
reflects relative abundance of corresp. mRNA in specific human
                                                                                                                            14-AUG-1996 (first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (SMIK)
                                                                                                                                                                                DNA encoding a Staphylococcus aureus protein of unknown function. Staphylococcus aureus protein; ribozyme; antisense sequence; control; Staphylococcal gene; regulatory element; bacterial gene expression; vaccine; staphylococcal infection; food poisoning; scaled skin syndrome; toxic shock syndrome; se.
syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences (and their fragments) are useful as primers or probes for isolating homologues of any of the S.aureus DNA sequences contained on the computer readable medium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence encodes a Staphylococcus aureus protein of unknown function. The present sequence was isolated from a library of clones of S. aureus WCUH 29 in Escherichia coll. The DNA sequence can be used in the construction of ribozymes and antisense sequence to control the expression of Staphylococcal genes. The DNA sequence is also useful as a source of regulatory elements for the control of bacterial agene expression. The encoded protein may be used to produce vaccines to enable a host to produce specific antibodies with antibacterial action. These vaccines and antibodies would protect a host against invasion by S. aureus, and conditions relating to Staphylococcal infection, e.g. Staphylococcal food poisoning, scaled skin syndrome, and toxic shock syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel polypeptide(s) from Staphylococcus aureus strain WCUH29 to isolate antimicrobial compounds, and in vaccines against S.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Black MT, Burnham MK, Hodgson JE, Knowles DJC, Nicholas RO,

```
DNA encoding a Staphylococcus aureus protein of unknown function. Staphylococcus aureus protein: ribozyme; antisense sequence; control; staphylococcal gene; regulatory element; bacterial gene expression; vaccine; Staphylococcal infection; food poisoning; scaled skin syndrome; toxic shock syndrome; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 aureus injection.

Claim 9; Page 874; 989pp; English.

Claim 9; Page 874; 989pp; English.

The present sequence encodes a Staphylococcus aureus protein of maknown function. The present sequence was isolated from a unknown function. The present sequence was isolated from a sequence can be used in the construction of ribozymes and antisense sequences to control the expression of Staphylococcal genes. The DNA sequence is also useful as a source of regulatory elements for the control of bacterial gene expression. The encoded protein may be used to produce vaccines to enable a host to produce specific antibodies with antibacterial action. These vaccines and antibodies would protect a host against invasion by S. aureus, and conditions relating to Staphylococcal infection, e.g. Staphylococcal food poisoning, scaled skin syndrome, and toxic shock syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       - nseq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 seq_documentation_block:

Of 4788 clones from a 10 day cell library screened with leaf cDNAs, 800 clones not present in the leaf were isolated. These were screened with cDNAs from ovule, root and flower mRNAs and resulted in 79 clones isolated. PCR analysis was then used to remove cross-hybridising clones. This resulted in the isolation of 18 cDNA clones specifically expressed in cotton fibre cells (T30242-4 and T30253-67). These cDNAs were then used to screen for homologous genomic sequences (T30245-53 and T30268) in order to obtain the corresp. promoter sequences.

This cDNA clone contains an insert of 1283 bp which is highly expressed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The promoters isolated from the fibre cell-specific clones can be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cotton fibre cell-specific cDNA clone CKFB10-E9.

Example 3; Column 45-46; 48pp; English.
Cotton cDNA clone E9 (T13048) was isolated from a cDNA library of cotton var. Coker 312 15-day-old boll cells using a subtractive hypridization procedure. The clone hybridises strongly to fiber RNA and weakly to pettal RA. E9 and other fibre-specific cDNA clones (see T13033-47 and T13049-T13050) were used to screen cotton genomic libraries, leading to the isolation of genomic clones (see T13025-53) contg. sequences capable of promoting gene expression in fibre cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolation of fibre-specific cotton promoter sequences - using selected DNA probes to screen genomic DNA fragments, for production of cotton fibres with improved characteristics

Example 4; Column 53-54; 33pp; English.
T162609-24 are cotton fibre-specific cDNA clones which can be used to identify genomic clones. This clone, CKFB15-E9, is expressed in fibre cells, but is also expressed at low levels in petal. (CK = Coker; FB = Fibre; 10, 15 or 23 = age in days of fibre cells; Al and the last character and number stand for clone identity). The fibre-specific genes were identified by differential cDNA library screenings. Coding sequences from these isolated genes are used in sense or antisense orientation to alter the fibre characteristics, e.g. strength, of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI; 97-108326/10.
Produced fransgenic cotton plants - by transformation with the H6 coding sequence or E6 anti-sense sequence, produces fibre of altered strength
generate transgenic cotton plants and lines producing fibres having altered quantity and quality.

DNA constructs contg. truncated promoter sequence - for fibre-specific gene expression in cotton plants
Example 3; Column 45-48; 48pp; 14911sh.
T70040-57 are cotton fibre-specific cona clones which can be used to obtain genomic clones containing fibre-specific promoters. Claimed DNA constructs comprise a truncated promoter sequence (from one of T70031-38) that promotes preferential gene expression in plant fibre cells, a protein coding sequence not naturally associated with the promoter sequence and a 3' termination sequence. The DNA constructs are useful for expressing foreign genes in fibre-producing plants, esp. to produce transgenic cotton plants with varied cotton fibre characteristics and quality. The present sequence comprises B9 cDNA isolated from clone CKFB15-E9 (CK = Coker; FB15 = 15 day old bolls).

CONTRACTOR DESCRIPTION OF THE PROPERTY OF THE
```

```
Immunogenic Mycobacterium tuberculosis polypeptide(s) and DNA - used to develop products for the detection of M. tuberculosis infection and for disgnosis, treatment and prevention of tuberculosis infection Claim 4; Page 194-195; 230pp; English.

This sequence encodes an immunogenic portion of a soluble Mycobacterium tuberculosis (MT) antigen which can be used in a method for inducing protective immunity against tuberculosis (TB). This sequence can be formulated into vaccines and/or pharmaceutical compositions for immunising against M. tuberculosis infection or may be used for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   M. tuberculosis immunogenic polypeptide RDIF7 DNA.
Tuberculosis; immunogenic; soluble; antigen; protective immunity; TB;
vaccine; pharmaceutical; infection; diagnosis; ss.
Mycobacterium tuberculosis antigen RDIF7. It was isolated from a M. tuberculosis strain Erdman genomic DNA expression library using rabbit anti-sera raised against M. tuberculosis fractionated proteins. Phage plaques expressing immunoreactive antigens were purified. The invention relates to compositions and methods for diagnosing tuberculosis. It provides Polypeptides (see W64291-W64379) comprising antigenic or immunogenic portions of M. tuberculosis antigenic or immunogenic portions of M. polypeptides, recombinant expression vectors and transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting M. tuberculosis infection in a patient using these polypeptides, antibodies or oligonucleotide probes and

with a modified polylinker; 1st strand cDNA was prepared
from normal prostate bulk tissue, and was then primed with
a Not I - oligo(dI) primer. Double-stranded cDNA was
ligated to Eco RI adaptors (Pharmacia), digested with Not
I and cloned into the Not I and Eco RI sites of the
modified pT773 vector. Library is not normalized. Library
was constructed by Bento Scares and M. Fatima Bonaldo. "

LOCUS AV285786 256 bp mRNA EST 09-NOV-1999
DEFINITION AV285786 RIKEN full-length enriched, 11 days pregnant adult female
ovary and uterus Mus musculus cDNA clone 5031414A18 similar to
AF030402 Mus musculus KH domain RNA binding protein QKI-5A mRNA,
AVO26198 251 bp mRNA EST 31-AUG-1999
AVO26198 Mus musculus adult C57BL/6J lung Mus musculus cDNA clone
1200018M16, mRNA sequence.
                                                                                                                                                                                                                                                                       Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Mammalia;

/lab_host="Anthone"
/note="Vector: p77730-Pac (Pharmacia) with a modified polylinker; lst strand cDNA was prepared from 3 pooled germ cell tumors, and was then primed with a Not I - ollgo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified p7773 vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo. "A Soares and M. Fatima Bonaldo."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Tumor Gene Index

W33781 standard; peptide; 6 AA.
W33781;
19-JUN-1998 (first entry)
Peptide #2 used in immunomodulating dimer peptide.
Immunomodulating dimer; immunosuppressant drug; CTL activation; transplantation; autoimmune disease; Class I HLA-B alpha-1 domain;
                                                                                                                                                             22-MAY-1998 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                         Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                 Misc_difference 1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     transplant rejection
Claim 10; Page 36; 41pp; English.
The present sequence is an immunomodulatory peptide, which
comprises a Class I HAA-B alpha-1 domain sequence. It can be used
in a pharmaceutical composition together with a subtherapeutic dose
of an immunomosuppressant, to extend the period of acceptance of a
transplant from a major histocompatibility complex (MHC) unmatched
donor, i.e. to inhibit transplant rejection. It can also be used in
the treatment of autoImmune diseases.
Peptides using the D-form amino acids are more effective
immunomodulators than their diastereomers or enantiomers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Location/Qualifiers

Claim 15; Page 35: 41pp; Engilsh.

Claim 15; Page 35: 41pp; Engilsh.

Cof the immunomodilating dimer peptides of the invention. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal advised and/or C-terminal antidated or including the N-terminal and/or C-terminal amidated or compound or variant is claimed which has immunomodulating activity, including the N-terminal and/or C-terminal amidated or comprises the formula: A-B. where A, B = (R aa76-77L) (aa79-84) or C camparises the formula: A-B. where A, B = (R aa76-77L) (aa79-84) or C camparises the formula: A-B. where A, B = (R aa76-77L) (aa79-84) or C camparises the formula: A-B. where A: aa77 = D, S or N; aa79 = R or G; camparises the formula: A-B. where A: aa79 = R or G; camparises the formula: A-B. where A: aa79 = R or G; camparises the peptide type bond or L; aa83 = G or R; and aa represents amino acid. The sequence in the brackets. The compounds comprise amino acid sequences related to brackets may optionally be absent or truncated at any peptide type bond within the brackets. They cam also be used in combination with antigenic peptides or proventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, rheumatoid arthritis and lupus erythematosis. The products can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel immunomodulatory peptide-type compound - useful for inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 10; Page 36; 41pp; English.

The present sequence is an immunomodulatory peptide, which comprises a Class I HLA-B alpha-1 domain sequence. It can be used in a pharmaceutical composition together with a subtherapeutic dose of an immunosuppressant, to extend the period of acceptance of a transplant from a major histocompatibility complex (MHC) unmatched donor, i.e. to inhibit transplant rejection. It can also be used in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI; 98-018220/02.
Novel immunomodulatory peptide-type compound - useful for inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is an immunomodulatory peptide, which comprises a class I HLA-B alpha-1 domain sequence. It can be used in a pharmaceutical composition together with a subtherapeutic dose of an immunosuppressant, to extend the period of acceptance of a transplant from a major histocompatibility complex (MHC) unmatched donor, i.e. to inhibit transplant rejection. It can also be used in the treatment of autoimmune diseases.
                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Immunomodulatory peptide.'

                                                                                                                                                                     remains and R95415-R55431 represent palindromes and fragments of human-leucocyte-associated antigens. This sequence represents the result of 1974 from a T-cell lysate. P74 is a T-cell surface membrane of protein associated with T-cell activation mammalian T-cells, and is also immunologically cross reactive with the heat shock protein HSC70. P74 is found in a limited number of cell types, but is particularly corpusessed on B and T cells. P74 can be isolated by lysis of a sultable column containing a covalently bound HLA-B270 palindromic peptide. CC column containing a covalently bound HLA-B270 palindromic peptide. CC compositions comprising the extracellular fragment of p74 combined with the HLA-B2702.60-84 (see R95416), induces calcium influx, and inhibits compounds can be screened for their effect on the cytolytic activity of compounds can be screened for their effect on the cytolytic activity of determining them with the extracellular portion of p74 and determining T-cells and antigen presenting cells (APCS), by adding to the mix the extracellular portion of p74, in an amount sufficient to compete with p74 for the binding of the p74 ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New liminomodulating dimer peptide(s) - based on a Class I HLA-B mupl; 98-086530/08.

New liminomodulating dimer peptide(s) - based on a Class I HLA-B mupl; 98-086530/08.

New liminomodulating dimer peptide(s) - based on a Class I HLA-B mupl alpha-1 domain, used for preventing rejection of transplants or treating autoimmune diseases

                                          activate CILS. They can also inhibit the proliferation of T cells in response to anti-CD3. The peptide can be used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, rheumatoid arthritis and lupus erythematosis. The products can also be
used in combination with antigenic peptides or proteins of interest to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DATE DATE OF THE PART OF THE P
                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 15; Page 36; 80pp; English.

R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HLA-B2702.

These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherrapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (comparate to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                  16-MAY-1996 (first entry)

HLA-B2702 CTL modulating peptide (B2702.84-75/75-84(T)).

Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Example 15; Page 36; 80pp; English.
R83061-R83085, R83090 and R92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is a dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example 15; Page 36; 80pp; English.

R83061-R83085, R83090-R83096 and R92207-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          12-NOV-1996 (first entry)

R95413, and R95415-R9543 represent palindromes and fragments of human-leucocyte-associated antigens. This sequence represents the human-leucocyte-associated antigens. This sequence represents the human-leucocyte-associated antigens. This sequence represents the the Protein Py4 from a T-cell lysate. Py4 is a T-cell surface membrane protein associated with T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein HSC70. This is found in a limited number of cell types, but is particularly expressed on B and T cells. Py4 is found in a limited number of cell types, but is particularly coll with an amphoteric detergent, and then passed through an affinity coll with an amphoteric detergent, and then passed through an affinity coll with an amphoteric detergent, and then passed through an affinity coll with an amphoteric detergent, and the passed through an affinity coll with an amphoteric detergent, and the passed through an affinity coll with an amphoteric detergent of the extracellular fragment of p74 combined with the HLA-B2702.60-84 (see R95416), induces calcium influx, and inhibits compounds can be screened for their effect on the cytolysis. Candidate compounds can be screened for their effect on the cytolysis. Candidate compounds the amount of binding between the candidate composition of CTL activity can be inhibited in a cellular composition containing T-cells and antigen presenting cells (APC8), by adding to the containing T-cells and antigen presenting cells (APC8), by adding to the containing T-cells and antigen presenting cells (APC8), by adding to the containing T-cells and antigen presenting cells (APC8), by adding to the containing T-cells and antigen presenting cells (APC8), by adding to the containing T-cells and antigen presenting cells (APC8), by adding to the containing T-cells and antigen presenting cells (APC8), by adding to 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Compans. Comprising lymphoid surface membrane proteins - which may inhibit cytolytic activity and differentiation of CTLs.

Will ye used tor preventing rejection of transplants or treating autofinanting dimer peptide(s) - based on a class I HLA-B alpha-1 domain, used for preventing rejection of transplants or treating autofinmune diseases.

Claim 16, Page 35; 41pp; English.

Profile of the invention. A peptide type compound or variant is claimed which has immunomodulating activity, including the N-terminal activity, where the peptide type compound comprises the formula; A-B, where A, B = (R aa76-77L) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or N; aa77 = D, S or N; aa79 = R or G; aa80 = I or N; aa81, aa84-a a represents amino acid; The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid; sequences related to a class I HLA-B alphal domain (positions 79-84). They can be used to inhibit cytotoxic of 1-1ymphocytes (CTL) from undesirably attacking cells in a host or in tructions of interest to activate CTLS. They can also be used in combination with antigenic peptides or proliferation of T cells in response to anti-CD3. The peptide can be cused for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, rheumatoid arthritis and lupus erythematosis.
                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
p74 and determining the amount of binding between the candidate compound and p74. Modulation of CTL activity can be inhibited in a cellular composition containing T-cells and antigen presenting cells (APCs), by adding to the mix the extracellular portion of p74, in an amount sufficient to compete with p74 for the binding of the p74 ligand. Sequence 20 AA:
                                                                                                                                                                                                                                                                                                                         Gaps

This sequence represents a specifically claimed immunomodulating dimer peptide of the invention. A peptide-type compound or variant is claimed which has immunomodulating activity, including the W-terminal activated and/or C-terminal amidated or esterified forms of up to 60 amino acids, where the peptide-type compound comprises the formula; A-B, where A, B er R a76-77L) (a270-84) or (a284-70; (lasa7)-68); a276 = E or visca7) = D, S or N; a29 = R or G; a280 = I or N; a281 and a captacesents annion acid; a282 = R or L; a283 = G or R; and as represents annion acid. The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a class I HLA-B absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a class I HLA-B absent or Trumcated at any peptide type bond within the brackets.

Tymphocytes (CTL) from undesirably attacking cells in a host or in the proliferation of T cells in response to anti-CD3. The peptide can be used for preventing rejection of transplants or for treating autoimmune the products can also be used for detection and diagnosis.

The products can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI: 98-086530/08.

New immunomodulating dimer peptide(s) - based on a Class I HLA-B alpha-1 domain, used for preventing rejection of transplants or treating autoimmune diseases.

Example 1: Page 19: 41pp; English.

Peptides W33784-98 and W33778-9 were assayed for their immunomodulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                           Immunomodulating dimer peptide #2.
Immunomodulating dimer; immunosuppressant drug; CTL activation;
transplantation; autoimmune disease; Class I HLA-B alpha-1 domain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Immunomodulating dimer; immunosuppressant drug; CTL activation; transplantation; autoimmune disease; Class I HLA-B alpha-1 domain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New immunomodulating dimer peptide(s) - based on a class I HLA-alpha-1 domain, used for preventing rejection of transplants or treating autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                19-JUN-1998 (first entry) Peptide B2702.84-75/75-84T tested for immunomodulating activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              100.0%; Score 29; DB 1; Length 20; 100.0%; Pred. ```
cc activity. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal acylated and/or cc immunomodulating activity, including the N-terminal acylated and/or cc c-terminal amidated or esterified forms of up to 60 amino acids, where creaming the peptide-type compound comprises the formula; A-B, where A, B = cc (R aa76-77L) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or V: aa77 = cc (R aa76-77L) (aa89 = R or L); aa83 = G or R; and aa represents amino acid. The sequence in the brackets may optionally be absent or truncated cat any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a class I HLA-B alphal domain (positions 79-84). They can be used to inhibit cytotoxic T-lymphocytes (CTL) from cused in combination with antiqenic peptides or proteins of interest to used in combination with antiqenic peptides or proteins of interest to cresponse to anti-cD3. The peptide can be used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, creamatoid arthritis and lupus erythematosis. The products can also be consent for detection and diagnosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SIMON J., GROSS R., RINGEL M., SCHMIDT E., KROEGER A.;
Submitted (JUL-1997) to the EMBL/Genbank/DDBJ databases.
-!- FUNCTION: DI-HEME CYTOCHROME OF THE FUMARATE REDUCTASE COMPLEX.
-!- SUBUNT: PARE OF AN ENZYME COMPLEX CONTAINING THREE SUBUNTS:
A FLAVOPROTEIN, AN IRON-SULFUR PROTEIN AND A CYTOCHROME B.
-!- SIMILARITY: TO CYTOCHROME B-558 FROM B.SUBFILIS SUCCINATE
DEHYDROGENASE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Wolinella succinogenes.
